

ProofTrade

evidence-driven autonomous spot trading agent

the thesis

an agentic system turns events into testable, bounded decisions

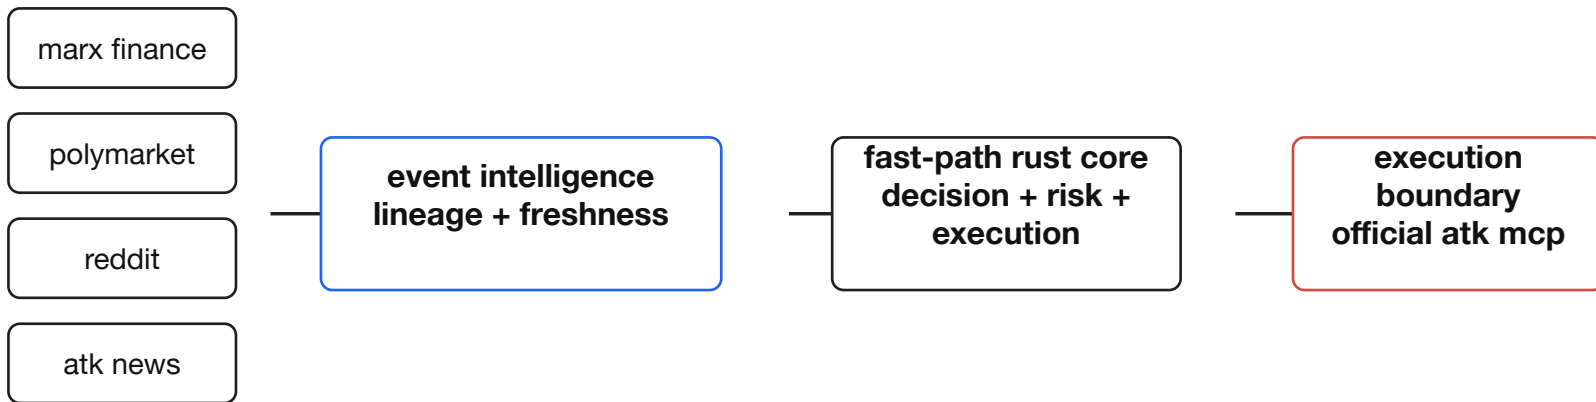

we do not ask an llm to predict a price.

we investigate events, weigh evidence, and wait for market confirmation.

- external sources form a hypothesis
- okx market data confirms or rejects it
- hold is valid when proof is weak
- risk and execution stay deterministic

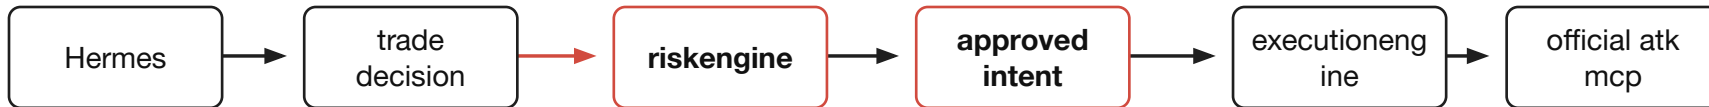

system overview

separate intelligence from the capital path

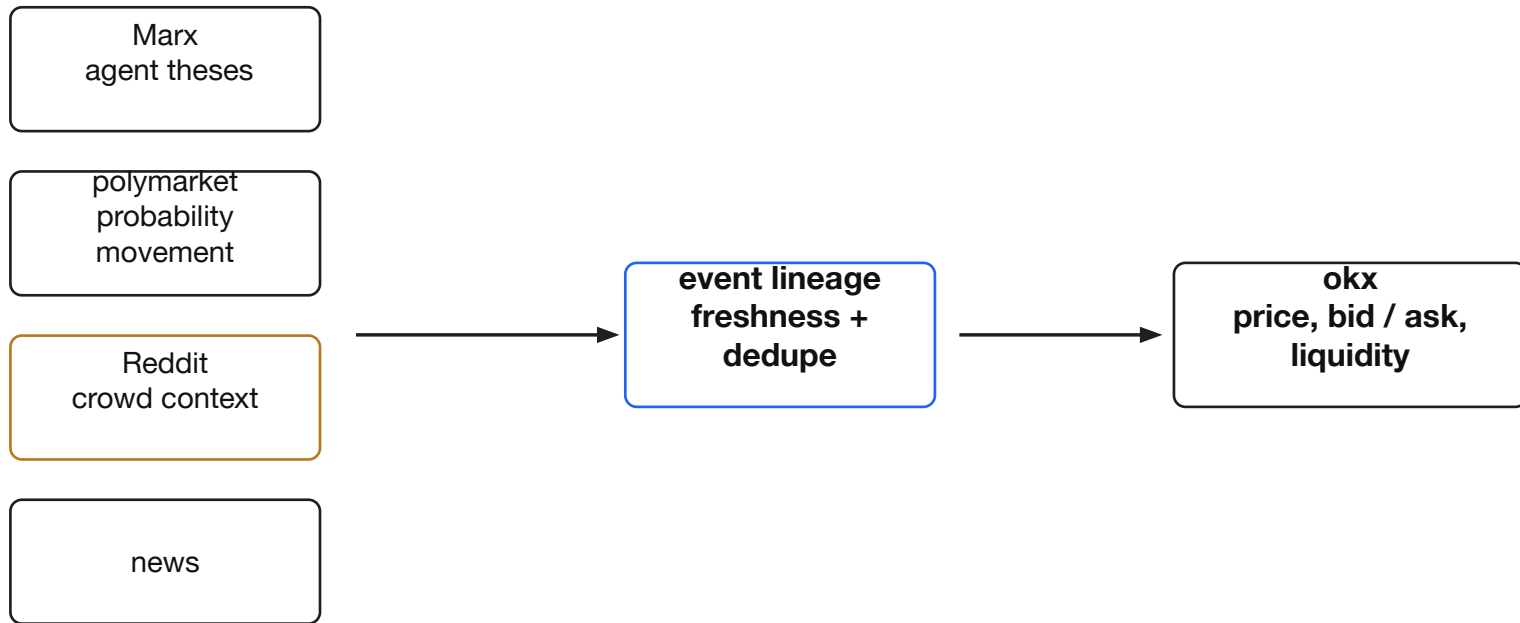

decision to capital

the agent proposes; RiskEngine decides whether exposure is allowed

evidence, not sentiment

different sources answer different questions
